Trends in Part C & D Star Rating Measure Cut Points

Introduction

One of CMS' most important strategic goals is to improve quality of care and general health status for Medicare beneficiaries, and we continue to make enhancements to the current Star Ratings methodology to further align it with our policy goals.

The current Part C & D Star Rating Technical Notes, including specifications and methodology for all measures, is available at: http://go.cms.gov/partcanddstarratings. For the 2024 Star Ratings, there are a total of 42 Part C and Part D measures. Over the years, unless there were specification changes, we generally see gradual changes in star cut points. This relative stability in cut points from year to year should enable plans to establish a baseline for performance for each measure. When there are shifts in the cut points, it is generally driven by changes in industry performance and/or the distribution of scores across contracts.

For the 2021 Star Ratings, the measures calculated based on HEDIS and CAHPS data collections were replaced with earlier values from the 2020 Star Ratings (for which data collection was not affected by the public health threats posed by COVID-19). The cut points for these measures were held constant from the 2020 Star Ratings. The HEDIS/HOS measures (Monitoring Physical Activity, Reducing the Risk of Falling, and Improving Bladder Control) were not included in the set of measures with values being carried forward from the 2020 Star Ratings.

Measure cut points for non-CAHPS measures are determined using a clustering algorithm in SAS. Conceptually, the clustering algorithm identifies natural gaps that exist within the distribution of the scores and creates groups (clusters) that are then used to identify the cut points that result in the creation of a pre-specified number of categories. For Star Ratings, the algorithm is run with the goal of identifying four cut points (labeled in the diagram below as A, B, C, and D) to create five non-overlapping groups that correspond to each of the Star Ratings (labeled in the diagram below as G1, G2, G3, G4, and G5). The contracts are grouped such that scores within the same Star Rating category are as similar as possible, and scores in different categories are as different as possible.

In this document, we display graphical trends of star cut points at the measure level, along with each measure's definition and data source. **Note, since various measures have specification changes over the years, not all changes in cut points indicate changes in average performance. Also, some measures are not included in all years. See the Part C & D Star Rating Technical Notes for specification changes each year.**

The quality improvement measures are not included because numeric values for each contract are not published. Measures that are too new to the Star Ratings to have four years of data are also not included. This includes measures returning to the Star Ratings after a specification change.

Beginning with the 2022 Star Ratings, mean resampling was added to the hierarchical clustering methodology that is used to set cut points for non-CAHPS measures. With mean resampling, measure-specific scores for the current year's Star Ratings are randomly separated into 10 equal-sized groups. The hierarchal clustering algorithm is then applied 10 times, each time leaving one of the 10 groups out of the clustered data. The method results in 10 sets of measure-specific cut points. The mean for each 1 through 5 star level cut point is taken across the 10 sets for each measure to produce the final cut points used for assigning measure stars.
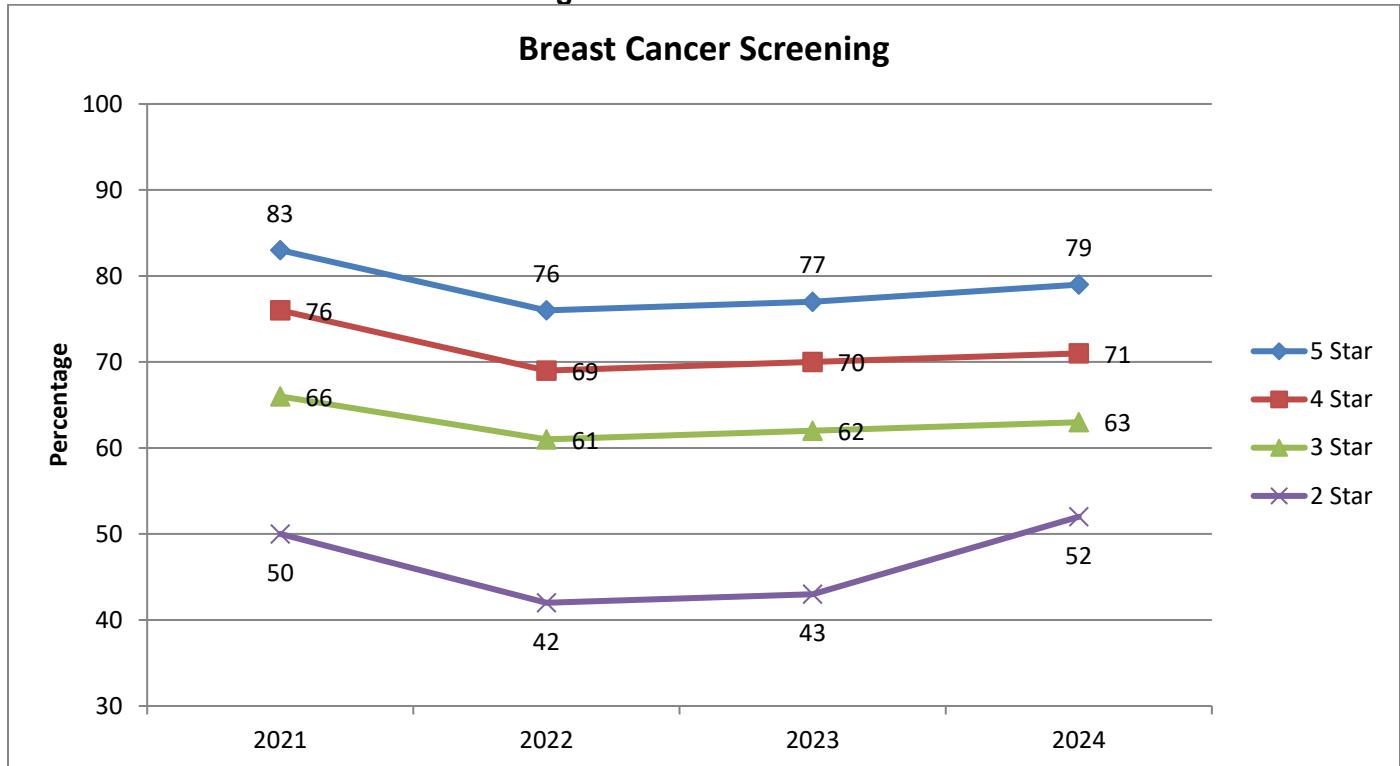

Beginning with the 2023 Star Ratings, bi-directional guardrails were added to the hierarchical clustering methodology that is used to set cut points for non-CAHPS measures. Guardrails are used to cap the amount of increase or decrease in measure cut point values from one year to the next. Specifically, each 1 to 5 star level cut point is compared to the prior year's value and capped at an increase or decrease of at most 5 percentage points for measures having a 0 to 100 scale (absolute percentage cap) or at most 5 percent of the current year's restricted score range for measures not having a 0 to 100 scale (restricted range cap). The final capped

cut points after comparing each 1 through 5 star level cut point to the prior year's values are used for assigning measure stars.

Beginning with the 2024 Star Ratings, Tukey outlier deletion was added to the hierarchical clustering methodology that is used to set cut points for non-CAHPS measures. Tukey outlier deletion involves removing Tukey outer fence outlier contract scores, those defined as measure-specific scores outside the bounds of 3.0 times the measure-specific interquartile range subtracted from the 1st quartile or added to the 3rd quartile. Outliers are removed prior to applying mean resampling within the hierarchical clustering algorithm. When we proposed and finalized Tukey outlier deletion in the 2021 final rule (CMS–4190–F), we described that in the first year of adding Tukey outlier deletion, the prior year's thresholds would be rerun, including mean resampling and Tukey outer fence deletion so that the guardrails would be applied such that there is consistency between the years. For the purposes of calculating the guardrails for the 2024 Star Ratings, the 2023 Star Ratings cut points were rerun including mean resampling, Tukey outlier deletion and no guardrails. These rerun 2023 Star Ratings cut points serve as the basis for applying the guardrails for the 2024 Star Ratings.

Part C Measures

Measure: C01 - Breast Cancer Screening

Breast Cancer Screening
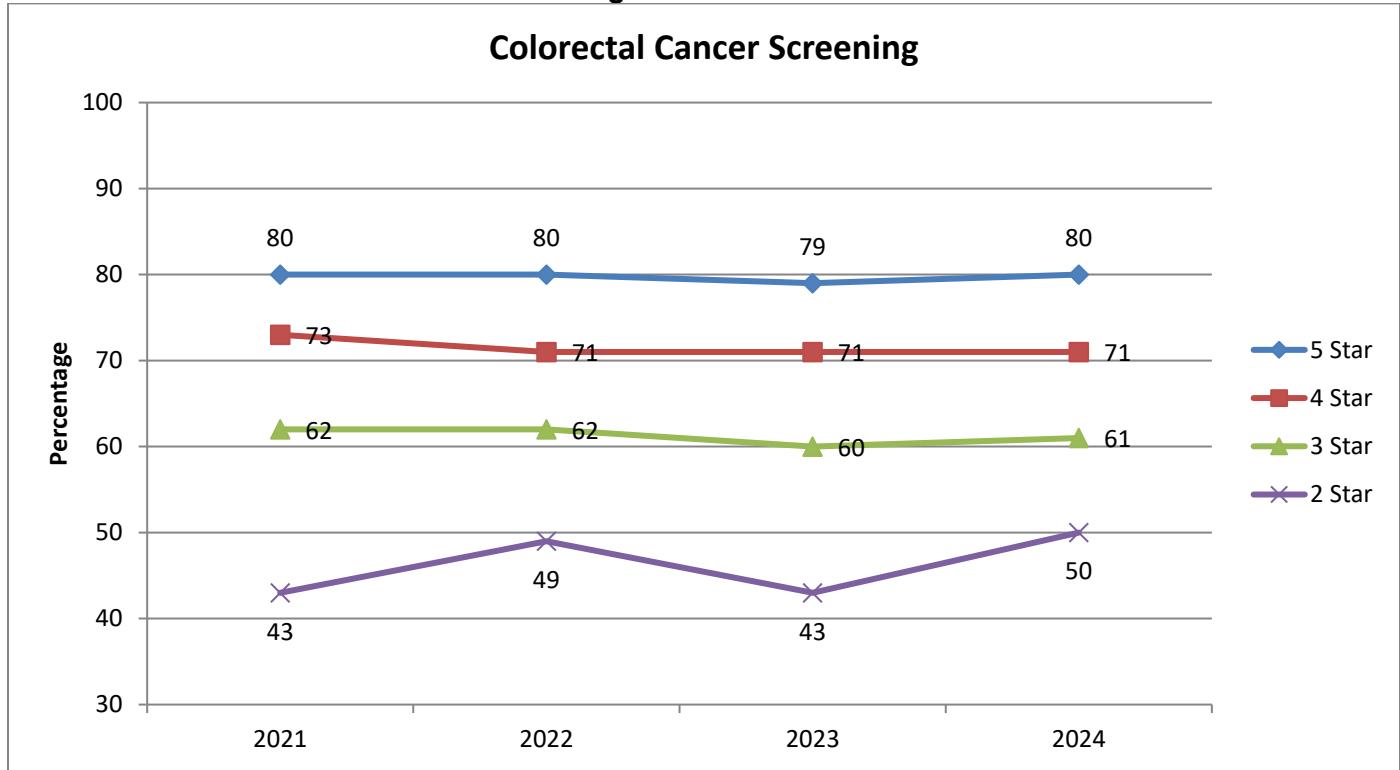

Title	Description

Measure: C05 - Special Needs Plan (SNP) Care Management

Special Needs Plan (SNP) Care Management

Title	Description
Description:	Percent of members whose plan did an assessment of their health needs and risks in the past year. The results of this review are used to help the member get the care they need. (Medicare does not collect this information from all plans. Medicare collects it only for Special Needs Plans. These plans are a type of Medicare Advantage plan designed for certain people with Medicare. Some Special Needs Plans are for people with certain chronic diseases and conditions, some are for people who have both Medicare and Medicaid, and some are for people who live in an institution such as a nursing home.)

Medication Reconciliation Post-Discharge
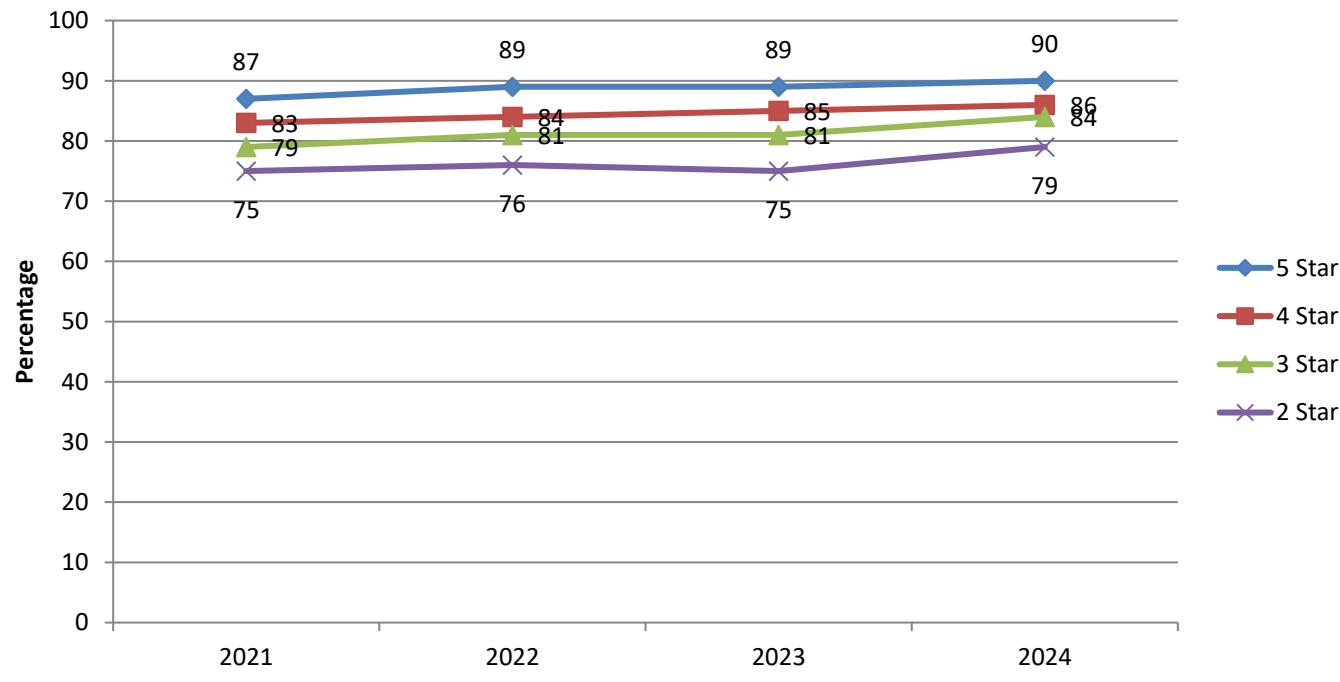

Title	Description
Description:	This shows the percent of plan members whose medication records were updated within 30 days after leaving the hospital. To update the record, a doctor or other health care professional looks at the new medications prescribed in the hospital and compares them with the other medications the patient takes. Updating medication records can help to prevent errors that can occur when medications are changed.

Measure: D11 - MTM Program Completion Rate for CMR

MTM Program Completion Rate for CMR: MAPD

| Title	Description
Description:	Some plan members are in a program (called a *Medication Therapy Management* program) to help them manage their drugs. The measure shows how many members in the program had an assessment of their medications from the plan. The assessment includes a discussion between the member and a pharmacist (or other health care professional) about all of the member's medications. The member also receives a written summary of the discussion, including an action plan that recommends what the member can do to better understand and use his or her medications.
Data Source:	Prescription Drug Event (PDE) Data
General Trend:	Higher is better

Measure: D12 - Statin Use in Persons with Diabetes (SUPD)

Statin Use in Persons with Diabetes (SUPD): MAPD

| Title	Description
Description:	To lower their risk of developing heart disease, most people with diabetes should take cholesterol medication. This rating is based on the percent of plan members with diabetes who take the most effective cholesterol-lowering drugs. Plans can help make sure their members get these prescriptions filled.
